Experiment 10 — Performance Optimization in Zoho Creator

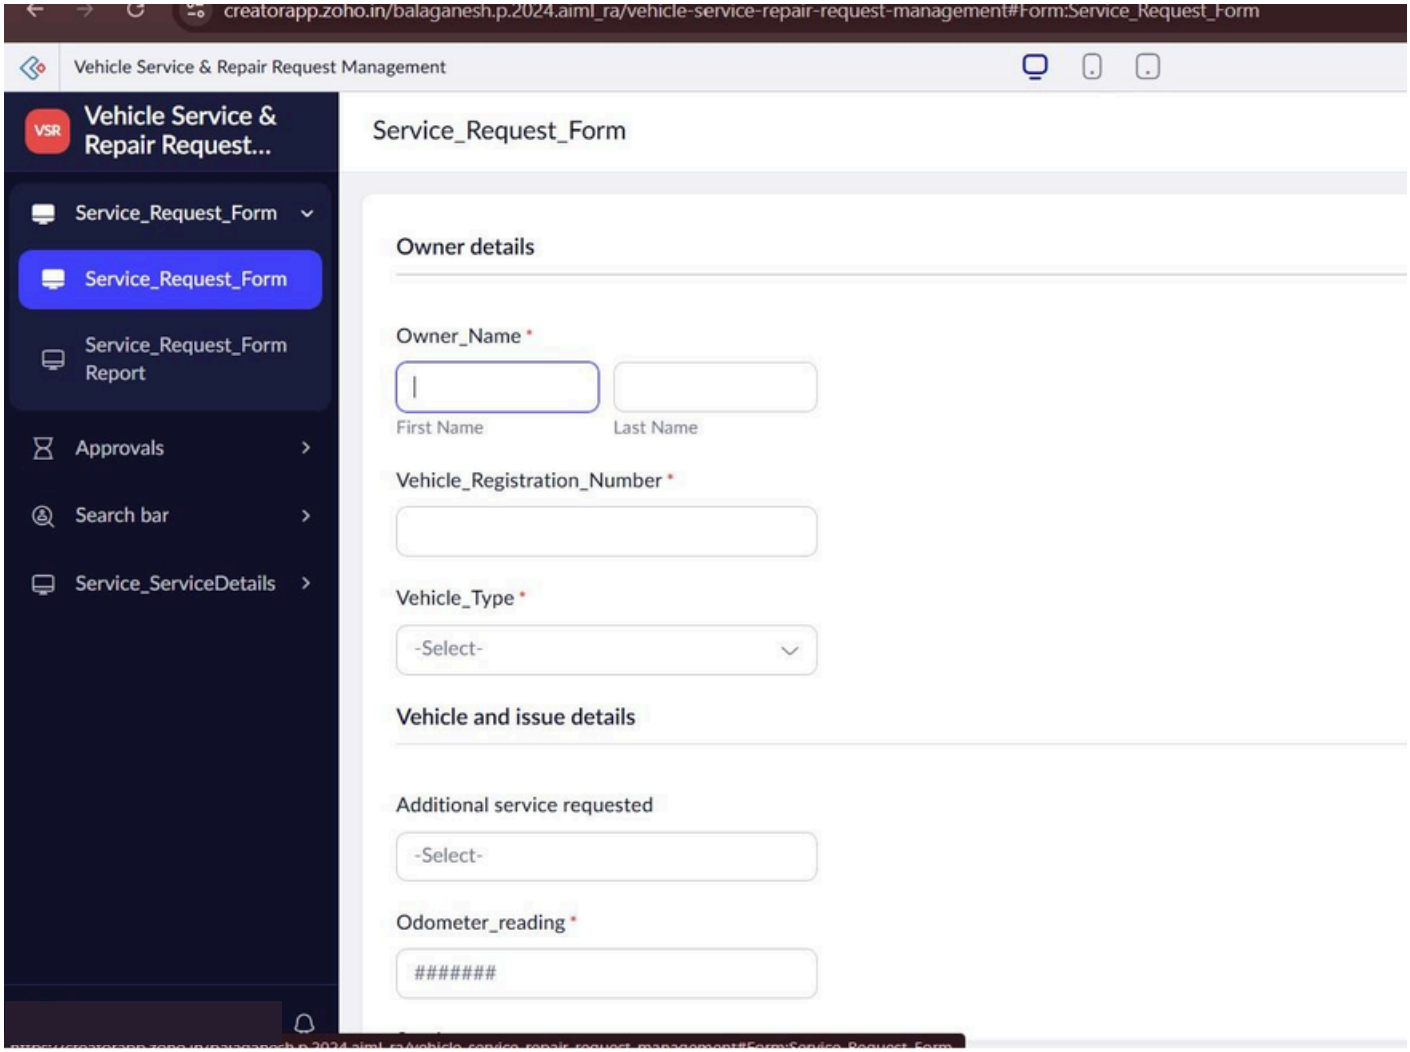

Aim: To improve the performance and efficiency of the Vehicle Service and Repair Request Management application developed using Zoho Creator.

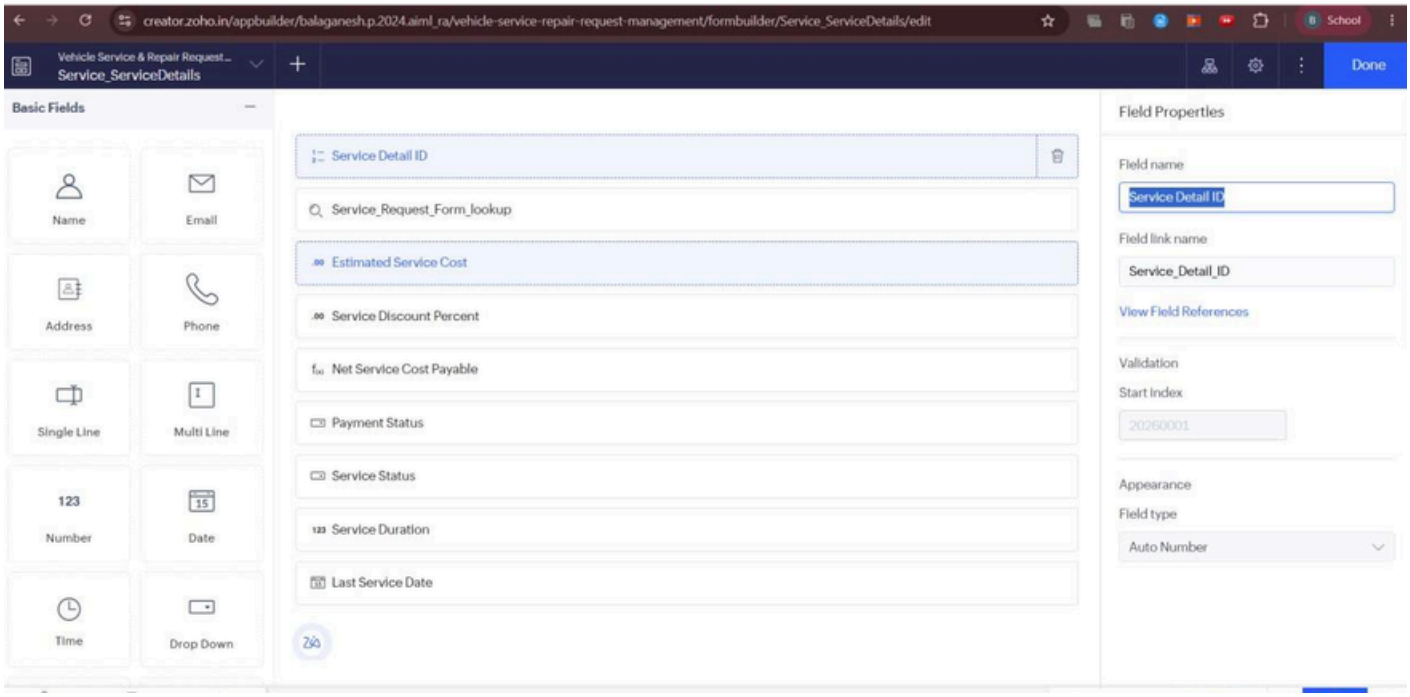

Procedure: First, I reviewed the existing Service Request form, reports, and pages to identify unnecessary fields and components. I optimized the service record search process by using appropriate search and filter options for Vehicle Registration Number, Owner Name, and Service Request ID. I reviewed the available Deluge workflows to identify and remove redundant operations wherever possible. I also checked the reports to ensure that only the required service details were displayed, making it easier to access vehicle information, customer details, and service status. Finally, I tested the application using multiple service records to observe its loading, searching, and record-processing behaviour.

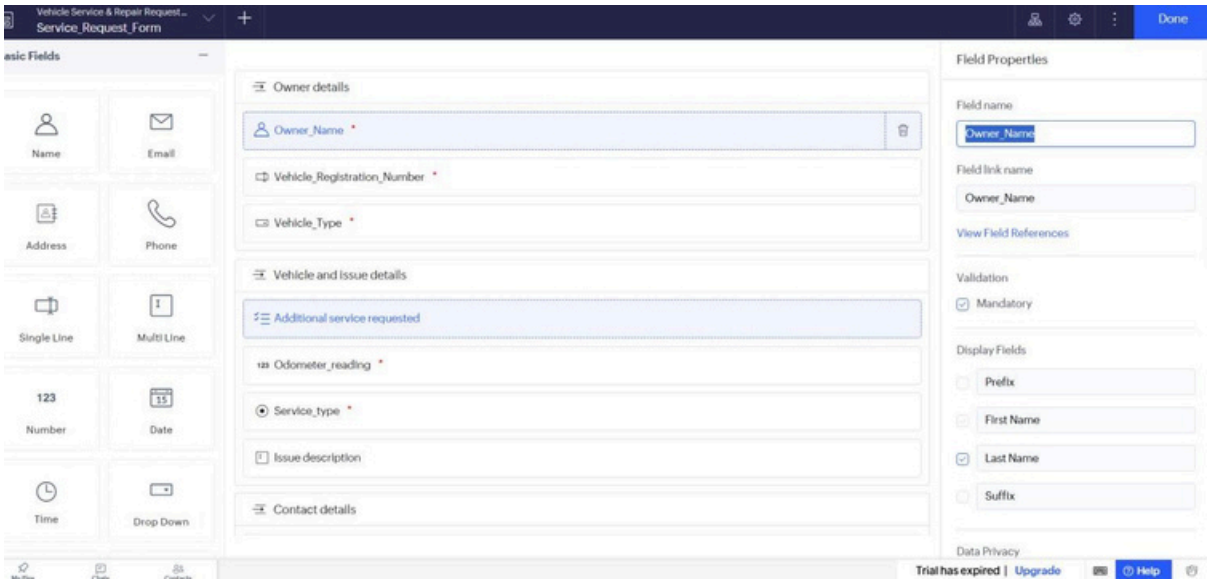

Result: The Vehicle Service and Repair Request Management application was reviewed and optimized to improve usability and record retrieval. The search and filtering process helps users locate service requests more efficiently, while reviewing workflows helps avoid unnecessary processing. Before-and-after screenshots of the search process and report layout can be used as evidence of the optimization performed. Actual response-time improvements should be reported only if measured during testing.

Separation of basic and advanced fields and removal of unnecessary fields
